Untyped (pure) λ -calculus

Frege's principle

○○○

Typed λ -calculus

Towards a NL fragment

Syntax

Let V be a countable set of variables. The set of all well-formed terms, Λ , is defined inductively as follows :

- $V \subset \Lambda$
- $\lambda x.t \in \Lambda \quad \forall x \in V, \forall t \in \Lambda$
- $(t_1)t_2 \in \Lambda \quad \forall t_1, t_2 \in \Lambda$

Untyped (pure) λ -calculus

Frege's principle

○○○

Typed λ -calculus

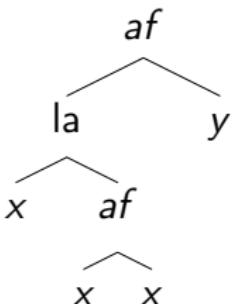

Towards a NL fragment

Syntax (cont'd)

The term $(\lambda x.(x)x)y$ has this syntactic structure :

$$af(la(x, af(x, x)), y)$$

Untyped (pure) λ -calculus

Frege's principle

○○○

Typed λ -calculus

Towards a NL fragment

Variable substitution

- $x_{[x:=z]} \rightsquigarrow z$
- $y_{[x:=z]} \rightsquigarrow y$ si $y \neq x$
- $(M)N_{[x:=z]} \rightsquigarrow (M_{[x:=z]})N_{[x:=z]}$
- $\lambda x. M_{[x:=z]} \rightsquigarrow \lambda z. M_{[x:=z]}$
- $\lambda y. M_{[x:=z]} \rightsquigarrow \lambda y. M_{[x:=z]}$ if $x \neq y$

○○○

Term substitution

- $x_{[x:=t]} \rightsquigarrow t$
- $y_{[x:=t]} \rightsquigarrow y$ si $y \neq x$
- $(M)N_{[x:=t]} \rightsquigarrow (M_{[x:=t]})N_{[x:=t]}$
- $\lambda y.M_{[x:=t]} \rightsquigarrow \lambda y.M_{[x:=t]}$ if y is not free in t .

α equivalence

$$\lambda x.\varphi \equiv \lambda z.\varphi_{[x:=z]}$$

Untyped (pure) λ -calculus

Frege's principle

○○○

Typed λ -calculus

Towards a NL fragment

Convention on variables

Let M be a term, x a variable. By convention, the occurrences of x in M are either all free or all bound.

It can be shown that every term constructed without respecting this convention is α -equivalent to a term that respects the convention.

Untyped (pure) λ -calculus

Frege's principle

○○○

Typed λ -calculus

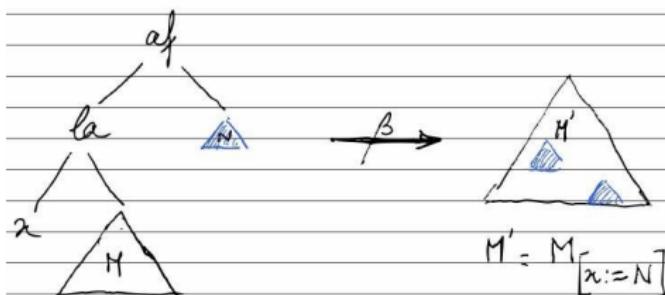

Towards a NL fragment

β equivalence

$$(\lambda x.M)N \equiv M_{[x:=N]}$$

Untyped (pure) λ -calculus

Frege's principle

○○○

Typed λ -calculus

Towards a NL fragment

Combinators

A combinator is a closed λ -term (ie without free variable)

Untyped (pure) λ -calculus

Frege's principle

○○○

Typed λ -calculus

Towards a NL fragment

Identity

$$I =_{\text{def}} \lambda x.x$$

For any term $t : (I)t \equiv t$

Untyped (pure) λ -calculus

Frege's principle

○○○

Typed λ -calculus

Towards a NL fragment

Booleans

$$T =_{\text{def}} \lambda x. \lambda y. x$$

$$F =_{\text{def}} \lambda x. \lambda y. y$$

This encoding allows to encode an if-then-else function :

$$\text{if } P \text{ then } Q \text{ else } R =_{\text{def}} ((P)Q)R.$$

if P is β -equivalent to T then $((P)Q)R$ will yield Q , while if P is β -equivalent (or β -reduces) to F , the outcome will be Q .

Untyped (pure) λ -calculus

Frege's principle

Typed λ -calculus

Towards a NL fragment

The IF combinator

$$\text{IF} =_{\text{def}} \lambda b. \lambda t. \lambda f. ((b)t)f$$

$$\text{NOT} =_{\text{def}} \lambda u. ((u)\text{F})\text{T}$$

$$\text{AND} =_{\text{def}} \lambda u. \lambda v. ((u)v)\text{F}$$

$$\text{OR} =_{\text{def}} \lambda u. \lambda v. ((u)\text{T})v$$

Untyped (pure) λ -calculus

Frege's principle

○○○

Typed λ -calculus

Towards a NL fragment

Church numerals

$$0 =_{\text{def}} \lambda f. \lambda x. x$$

$$1 =_{\text{def}} \lambda f. \lambda x. (f)x$$

$$n =_{\text{def}} \lambda f. \lambda x. (f)(f) \dots (f)x$$

with n times f

$$\begin{aligned} \text{Succ} &=_{\text{def}} \lambda n. \lambda f. \lambda x. ((n)f)x \\ &\quad + \equiv \lambda m. \lambda n. \lambda f. \lambda x. ((m)f)((n)f)x \\ &\quad * \equiv \lambda m. \lambda n. \lambda f. (m)(n)f \end{aligned}$$

Untyped (pure) λ -calculus

Frege's principle

Typed λ -calculus

Towards a NL fragment

Frege's principle

The meaning of an expression is uniquely determined by the meanings of its parts and their mode of combination.

Motivation : Humboldt's view on finite means for infinite sentences

Consequences

- Locality principle : lexical items have a meaning that is independant of the expression they occur in.
- Substitution principle : synonymous expressions may be substituted for each other without changing the meaning of the complex expression in which they occur.
- Parts of well formed sentences have « meaning »
- Meanings can be « composed » : Frege's saturation idea

λ -terms can represent individual meanings and functional application can represent semantic composition.

Untyped (pure) λ -calculus

Frege's principle

Typed λ -calculus

Towards a NL fragment

Type theory

1. e is a type
2. t is a type
3. if a and b are types, then $\langle a, b \rangle$ is a type

Untyped (pure) λ -calculus

Frege's principle

○○○

Typed λ -calculus

Towards a NL fragment

Type theory

1. e is a type
 2. t is a type
 3. if a and b are types, then $\langle a, b \rangle$ is a type
- $D_e = A$
 - $D_t = \{0, 1\}$
 - $D_{\langle a, b \rangle}$ = the set of mappings from D_a to D_b .

Meaningful expressions

For a, b types :

- variables and individual constants of type a belong to ME_a .
- if $\alpha \in ME_{\langle a,b \rangle}$ and $\beta \in ME_a$ then $(\alpha)\beta \in ME_b$.
- if u is a variable of type a and $\alpha \in ME_b$, then $\lambda u.\alpha \in ME_{\langle a,b \rangle}$.
- if φ and ψ are in ME_t , then the following expressions are also in ME_t : $\neg\varphi$, $(\varphi \wedge \psi)$, $(\varphi \vee \psi)$, $(\varphi \rightarrow \psi)$.
- if φ is in ME_t and u is a type a variable, then $\forall u\varphi$ and $\exists u\varphi$ are in ME_t .

 0 \leftarrow s &
 \end{array} \\
 \hline
 \begin{array}{cc}
 V \rightarrow \text{sleeps} & \\
 0 \leftarrow \lambda x.(S)x &
 \end{array}
 \end{array}$$

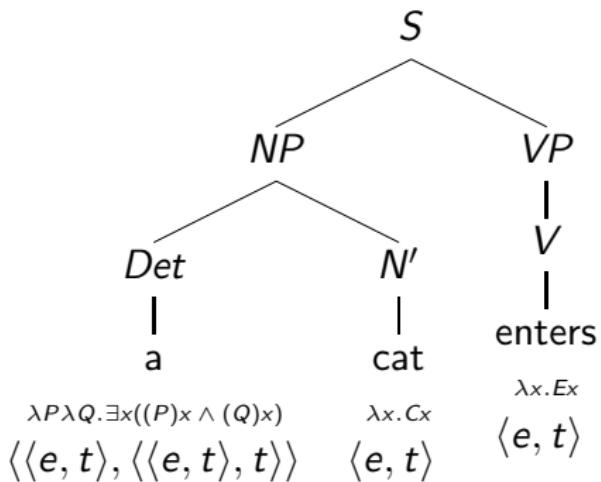

Roadmap for the fragment

- A cat enters $\exists x (Cx \wedge Ex)$
- Sam likes Pam Lsp (or $((L)s)p$)
- Everyone likes Pam $\forall x (Px \rightarrow Lxp)$
- Everyone likes an actress $\forall x (Px \rightarrow \exists y (Ay \wedge Lxy))$
- Sam is mortal Ms
- Sam met a tall person $\exists x((Px \wedge Tx) \wedge Msx)$
- Sam doesn't sleep $\neg Ss$

Quantified sentences

- (1) a. A cat enters
 b. $\exists x (Cx \wedge Ex)$

S	\rightarrow	NP	VP
0	\leftarrow	(1)	2
NP	\rightarrow	Det	N'
0	\leftarrow	(1)	2
VP	\rightarrow	V	
0	\leftarrow	1	

Excursus : Generalized Quantifiers

1. NL Quantifiers vs Logic Quantifiers

- Restriction
- Lack of parallelism

[Jean NP] dort

$dort(j)$

[Certains hommes NP] dorment

$\exists x (Hx \wedge Dx)$

[Tous les hommes NP] dorment

$\forall x (Hx \rightarrow Dx)$

[Au moins deux hommes NP] dorment

$\exists x \exists y (x \neq y \wedge Hx \wedge Hy \wedge Dx \wedge Dy)$

- Lack of expressivity

- (2) a. Un nombre fini d'étoiles sont sensibles à l'attraction du soleil.
- b. Plus de la moitié des amis de Jean sont parisiens.
- c. La plupart des gens ont voté Chirac.

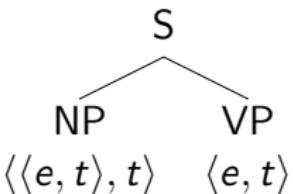

Excursus : Generalized Quantifiers

2. Generalized Quantifiers

3. Thesis : $\llbracket \text{NP} \rrbracket = \text{GQ}$

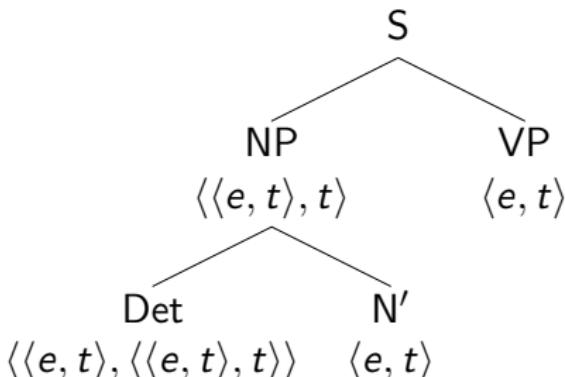

- (3)
- a. $\llbracket \text{Tous les N} \rrbracket = \{X \subseteq E / \llbracket \text{N} \rrbracket \subseteq X\}$
 - b. $\llbracket \text{Quelques N} \rrbracket = \{X \subseteq E / \llbracket \text{N} \rrbracket \cap X \neq \emptyset\}$
 - c. $\llbracket \text{Jean} \rrbracket = \{X \subseteq E / j \in X\}$
 - d. $\llbracket \text{Au moins deux N} \rrbracket = \{X \subseteq E / |\llbracket \text{N} \rrbracket \cap X| \geq 2\}$
 - e. $\llbracket \text{La plupart des N} \rrbracket = \{X \subseteq E / |\llbracket \text{N} \rrbracket \cap X| \geq |\llbracket \text{N} \rrbracket \setminus X|\}$

Excursus : Generalized Quantifiers

- (4)
- a. $\llbracket \text{Tous les } A \ B \rrbracket = 1 \Leftrightarrow \llbracket A \rrbracket \subseteq \llbracket B \rrbracket$
 - b. $\llbracket \text{Certains } A \ B \rrbracket = 1 \Leftrightarrow \llbracket A \rrbracket \cap \llbracket B \rrbracket \neq \emptyset$
 - c. $\llbracket \text{La plupart } A \ B \rrbracket = 1 \Leftrightarrow |\llbracket A \rrbracket \cap \llbracket B \rrbracket| \geq |\llbracket A \rrbracket \setminus \llbracket B \rrbracket|$
 - d. $\llbracket \text{Beaucoup } A \ B \rrbracket = 1 \Leftrightarrow |\llbracket A \rrbracket \cap \llbracket B \rrbracket| \geq m|\llbracket A \rrbracket|$

4. Determiners \subset binary set relations
